

Results: Field Overview

Results: Field Overview I

The de-duplicated corpus for $\{\{\mathbf{SEARCH_TERM_TITLE}\}\}$ contains $N = CORPUS_SIZE$ records spanning $\{\{\mathbf{YEAR_START}\}\} - \{\{\mathbf{YEAR_END}\}\}$ ($\{\{\mathbf{YEAR_SPAN}\}\}$ years). Publication volume grows at a compound annual rate of $\{\{\mathbf{CAGR_PCT}\}\}\%$ (mean year-over-year growth $\{\{\mathbf{MEAN_YOY_GROWTH_PCT}\}\}\%$, doubling time $\{\{\mathbf{DOUBLING_TIME}\}\}$ years), peaking in $\{\{\mathbf{PEAK_YEAR}\}\}$ with $\{\{\mathbf{PEAK_YEAR_PUBS}\}\}$ records that year. The growth curve is a first-order descriptive summary of the retained corpus; it is not a field-wide estimate of research activity.

Results: Field Overview II

Figure 1: Publication growth curve for `{{SEARCH_TERM_TITLE}}`. Annual publication counts (bars) and cumulative total (line) show sustained growth from `{{YEAR_START}}` through `{{YEAR_END}}`, peaking in `{{PEAK_YEAR}}`.

RQ1: Field Size and Growth I

The temporal analysis describes a retained literature slice spanning $\{\{\text{YEAR_SPAN}\}\}$ years. The compound annual growth rate of $\{\{\text{CAGR_PCT}\}\}\%$ implies a corpus doubling time of approximately $\{\{\text{DOUBLING_TIME}\}\}$ years under the configured retrieval and indexing conditions. The peak year $\{\{\text{PEAK_YEAR}\}\}$ contains $\{\{\text{PEAK_YEAR_PUBS}\}\}$ retained records; that count may reflect both publication activity and delays or differences in source indexing, so it should not be interpreted as a causal trend without a live coverage audit.

Table 1. Top publication years.

$\{\{\text{YEAR_COUNT_TABLE}\}\}$

RQ2: Subfield Composition I

Records distribute across the $\{\{N_SUBFIELDS\}\}$ configured subfields as shown in Table 2, with $\{\{TOP_SUBFIELD\}\}$ the largest bucket at $\{\{TOP_SUBFIELD_PCT\}\}\%$ of the classified corpus. The dominance of $\{\{TOP_SUBFIELD\}\}$ is a property of the configured taxonomy and retained corpus. It is not a domain prevalence estimate without a live, source-backed review and a documented coverage assessment.

Table 2. Subfield distribution.

RQ2: Subfield Composition II

RQ2: Subfield Composition III

Figure 2: Field summary dashboard for `{{SEARCH_TERM_TITLE}}`. The dashboard combines corpus size, temporal range, subfield distribution, and key bibliometric indicators in a single overview panel.

RQ2: Subfield Composition IV

Subfield Distribution

RQ2: Subfield Composition V

Figure 3: Subfield distribution for $\{\{\text{SEARCH_TERM_TITLE}\}\}$. The $\{\{\text{N_SUBFIELDS}\}\}$ -bucket taxonomy shows the relative weight of each configured sub-area, with $\{\{\text{TOP_SUBFIELD}\}\}$ dominant at $\{\{\text{TOP_SUBFIELD_PCT}\}\}\%$.

RQ2: Subfield Composition VI

Figure 4: Subfield timeline for $\{\{\text{SEARCH_TERM_TITLE}\}\}$. Stacked annual publication counts by subfield show how each sub-area has evolved over time, revealing emerging and declining research threads.

Identifier and Full-Text Coverage I

The corpus has measurable identifier coverage: $\{\{DOI_COUNT\}\}$ of $\{\{CORPUS_SIZE\}\}$ records ($\{\{PCT_WITH_DOI\}\}\%$) carry DOIs, supporting cross-engine de-duplication. OpenAlex IDs are present for $\{\{OPENALEX_ID_COUNT\}\}$ records. Abstract coverage stands at $\{\{ABSTRACT_COVERAGE_PCT\}\}\%$ ($\{\{ABSTRACT_COUNT\}\}$ records), which limits the text analytics to that subset. Open-access status is confirmed for $\{\{OA_PCT\}\}\%$ of records, and $\{\{PDF_AVAIL_PCT\}\}\%$ have a direct PDF link.

Descriptive Bibliometrics I

The corpus spans $\{\{\text{UNIQUE_AUTHORS}\}\}$ unique authors across $\{\{\text{CORPUS_SIZE}\}\}$ papers, yielding a mean of $\{\{\text{PAPERS_PER_AUTHOR_MEAN}\}\}$ papers per author. Citation counts range from zero to $\{\{\text{CITATION_MAX}\}\}$ (mean $\{\{\text{CITATION_MEAN}\}\}$, median $\{\{\text{CITATION_MEDIAN}\}\}$), with a total of $\{\{\text{CITATION_TOTAL}\}\}$ citations across the corpus. The Gini coefficient of citation concentration is $\{\{\text{GINI_COEFFICIENT}\}\}$. This statistic describes concentration within the retained corpus and should not be generalized to citation behavior in the field.

Table 3. Citation count distribution.

$\{\{\text{CITATION_DIST_TABLE}\}\}$

Citation Distribution (Gini = 0.421, N = 70, Total = 2,593)

Figure 5: Citation distribution for $\{\{\text{SEARCH_TERM_TITLE}\}\}$. The histogram shows the number of papers in each citation-count bucket, with the Gini coefficient annotated. The distribution is a descriptive property of the retained corpus.

Descriptive Bibliometrics III

Table 4. Top publication venues.

{{TOP_VENUES_TABLE}}

Descriptive Bibliometrics IV

Figure 6: Top publication venues for `{{SEARCH_TERM_TITLE}}`. The horizontal bar chart shows the venues with the most retained records; it describes this corpus rather than the complete field.

Table 5. Top authors by publication count.

`{{TOP_AUTHORS_TABLE}}`

Descriptive Bibliometrics V

Top 20 Authors by Publication Count

Figure 7: Author productivity for $\{\{\text{SEARCH_TERM_TITLE}\}\}$. The horizontal bar chart shows authors with the most retained records; names and counts depend on source coverage and deduplication.
